

Cybersafety Travel Tips

KNOWLEDGEFLOW
CYBERSAFETY FOUNDATION

Be cautious of public Wifi

When at a hotel, restaurants, and places with free Wi-Fi hotspots, avoid accessing personal accounts and sensitive data while connected to that network as you could be vulnerable to security issues.

Disable Bluetooth connectivity

Keeping your Bluetooth disabled in public can help minimize the risk of hackers breaching your device.

Install & update antivirus software

Installing an antivirus software and regularly making sure it is up to date will help improve your device's ability to defend against malware.

Guard your devices

Keep your devices secured. Never leave your devices unattended and unlocked. You can also minimize the time of your screen lock for extra security. This can prevent theft and unauthorized access or loss of sensitive information.
